## Fill Balancer Disc

Keeping the top fitment centered in the shipper is ideal for achieving maximum fill volume. Fill hoses can be difficult to handle and if not supported well will pull the top fitment off-center. If the hose tips the fitment over sideways during the fill process, higher viscosity products will flow into the bag at an angle, resulting in a lopsided bag.

Arena's Fill Balancer Disc supports the top fitment during the fill process, providing for a uniform fill. When used with a 45° Degree Elbow, the angle at the hose connection is reduced, making for a much easier connect/disconnect. Stress on the bag fitment and surrounding seal are also greatly reduced when using this combination of accessories.

AP3290 – Fill Balancer Disc  
AP3107 - 45° Tri-Clamp Elbow

For more information on this very useful accessory, please contact your Arena sales representative.
